Progressive patient movement through Neuro rehabilitation by Body weight support system Department of Neurophysiotherapy

A 48 year male patient with pontine hemorrhage was admitted at Parul Sevashram hospital and was advised for physiotherapy treatment. On assessment the patient was found to have 6th cranial nerve palsy, visual impairment, affected proprioception and balance issues.

Continuous and expert guided physiotherapy for 2 months in the form of mat exercises, sitting balance training, weight bearing exercises, PNF techniques, the patient has shown progressive results and is happy to stand with support.
