

## **A rare case of unilateral nevus Comedonicus with Dermatomal distribution managed successfully at Parul Sevashram Hospital**

**Consulting Doctors:** Dr. Krunal Tralsawala, Dr. Arti Bhabhor

A female patient aged 38 years presented to the Department of Dermatology at Parul Sevashram hospital with complaint of groups of discrete pits filled with Keratin resembling Comedones over her left shoulder extending to left arm, left forearm and left lower back. Patient also had a similar complaint over the left side of the face. The lesions were present since birth and gradually increasing in size not associated with itching. Patient has episodes of discharge and suppuration occasionally.

On Evaluation, Cutaneous Examination revealed multiple dilated Follicular openings filled with black plugs over the left shoulder, left arm, left forearm, left lower back and left side of the face, which is arranged linearly.

A punch Biopsy was done from the lesion, Histopathology showed Epidermal Hyperplasia with increased number of Melanocytes in the basal layer. The Epidermis shows Deep Invagination filled with Keratin resembling dilated hair follicle.

Based on the Clinical Characteristics and Histopathology findings Patient is diagnosed with Nevus Comedonicus and started Topical Retinoids & Oral Antibiotics at present.
